# Future-proofing your business

Embracing sustainable storage solutions

We're living in a data-heavy world, with data centres storing massive amounts of information. Somewhere between **30% to 60% of this data, is actually unnecessary.** Imagine all the resources being wasted on storing stuff we don't even need!

Money and the Environment

Businesses in the UK spend around **£200,000** each year just to manage and store their data.

Powering data centres contributes **2.5%** of human-induced CO2 emissions.

The solution is to simplify and modernise storage solutions. Businesses need to assess their data, costs, and discard what's unnecessary. **This is where Logicalis comes in!**

We offer thorough assessments and expert guidance to help you answer important questions like:

- **What data do you have?**
- **How much does storing that data cost?**
- **What data can be discarded?**

The game changer

NetApp hybrid flash storage, **allows you to use both** on-premise and cloud-based storage.

NetApp hybrid flash storage provides **transparent information** on your energy consumption.

Modern flash storage technology, like NetApp hybrid flash storage, uses less power than traditional hard disk drives (HDDs), and they compresses that data, which means you can **store more in a smaller space.** Not only will your energy savings be substantial, you'll be able to access information on those energy savings through the dashboard at any time.

With 20 years of experience, Logicalis are here to help you thrive in an ever-evolving digital landscape.
